WHAT WE DO

Business process transformations along with database transformations are extremely difficult, time consuming and expensive. The need for database transformations is growing rapidly, caused by increasing company consolidations, acquisitions, and reorganizations, which pose significant financial and corporate governance risk. Millions of man hours are spent hand engineering these transformations, often with failed implementations costing billions of dollars.

eprentise has solved this problem by the application of automated mining technology which identifies rules and creates standard repeatable transformation processes, eliminating failures and data conflicts, and dramatically reducing overall transformation time. eprentise is able to offer an out-of-the box product that is as flexible and powerful as custom programming, with higher quality and at a fraction of the cost. eprentise has also invested in a new line of products including an automated audit product and a collection of analytics to provide clients visibility into their business processes and data.

HIGHLIGHTS

- Transformation solutions target larger companies that complete acquisitions/divestitures, change accounting calendars, incur expensive audits, change charts of accounts, merge or split organization structures.
- Optimization products are geared to companies who lack insight into duplicate payments and potential fraud activities.
- Enterprise products that help businesses align systems to an ever-changing business landscape, compliance and regulations while managing TCO.
- eprentise has accumulated exemplary customer base of Global 2000 firms – most sales are due to great word of mouth and repeat customers.
- Patented Consolidation Software.
- Some of eprentise's solutions install and complete in a matter of a few days. More complex projects are completed in a few months. Expensive third-party implementers are not needed.
- eprentise team has significant, deep and expert knowledge of internal workings of accounting software packages, especially Oracle EBS.
